

SYNTHETIC INPUTS · PRIVATE EVIDENCE FORMAT

See what changed— not just whether it rendered.

A virtual try-on result can look polished and still change the person or invent product details. This sample shows how a real audit separates visible success, drift and limits.

1 complete route represented	3 product references checked	0 customer photos or private access

VISUAL-OUTPUT REVIEW

A useful result,
with visible limits.

Observed from the displayed synthetic person, three separate product references and one generated output. No claim is made about the model, prompt or runtime that produced it.

01	Identity continuity The output preserves a broadly similar adult model, but facial structure, eye shape and hairstyle visibly change. A shopper may read this as a different person rather than the same person in new clothes.	VISIBLE DRIFT
02	Top and bottoms fidelity The burgundy polo, short sleeves, collar, button placket, grey colour and wide trouser silhouette remain recognizable. Fine knit texture, exact pleat structure and construction details are not proven at this output scale.	DIRECTION KEPT
03	Shoe evidence White low-top shoes appear in the result, but their small rendered size does not support a reliable judgment about stitching, sole profile or exact product identity.	INSUFFICIENT DETAIL
04	Composition and background The full body and all three clothing regions remain visible. The warm studio background is retained, but lighting and pose differ enough that before-and-after comparison should not be treated as exact product evidence.	COMPARE CAREFULLY

What a paid 10-case audit adds - Exact public route and viewport - Input and output evidence per case - Completion and failure handling - Identity and body drift	- Garment and accessory fidelity - Repeated-output stability - Severity and reproduction notes - Private delivery and one review round
